

Who are LEGION EMPEROR hubs designed for?

LEGION EMPEROR hubs are designed to meet the expectations of the most demanding cyclists, looking for performance, reliability and precision.

Inspired by the classics of the 90s, the LEGION EMPEROR hubs take up the concept of large flanges for a simple reason: rigidity!

This iconic design allows for better tension distribution in the wheel, reducing flex and optimizing power transmission.

Result: sharper acceleration and better stability in sprints and rolls.

Manufacturing quality:

CNC machining from 6061-T6 aluminum guarantees high dimensional accuracy and a refined finish.

This material is renowned for its strength and lightness, making it an excellent choice for bicycle components.

High-performance engagement system:

The 7075 T-6 aluminum driver, even stronger than 6061, combined with 6 micro-toothed pawls, provides rapid and consistent engagement with 180 points of engagement.

This system ensures optimal responsiveness during acceleration.

Large flask concept

- Increased rigidity: For optimal power transmission and better responsiveness.
- Steering precision: For more precise trajectories and better control of the bike.
- Durability: A more robust construction to withstand the most intense stresses.

Compatibility and easy installation:

The ISO6 mounting standard is widely used, ensuring compatibility with numerous disc brake types.

This significantly simplifies installation and allows these hubs to adapt to a variety of configurations.

Complete package:

The hub pair comes with all the necessary components for installation, such as a 20mm front axle, spacers, and a lock ring.

This greatly simplifies installation and allows for adjustment of the chainline to fit various bike types.

SPECIFICATIONS

- Material: 6061-T6 Aluminum
- Front hub spacing: 100x20mm (10mm adapter available)
- Rear hub spacing: 110x10mm
- Outer flange diameter: 74 mm
- PCD diameter: 64 mm
- Number of holes: 36
- Driver standard: Shimano
- Engagement type: 180 points / 6 pawls
- Disc mount: ISO6
- Front hub bearings: Enduro Bearing - 6805LLB (Japan)
- Rear hub bearings: Enduro Bearing - 6902RS (Japan)
- Weight: 265g (Front) / 408g (Rear)
